Antique mirror - processing notes

TECHNICAL NOTES ON THE FABRICATION AND INSTALLATION OF OUR PRODUCTS

Product information by manufacturer:

ANTIQUÉ MIRROR is a product with special characteristics, when compared to plain transparent mirror. We therefore recommend that certain precautions be taken when handling, fabricating and installing our products; this should always be undertaken with the greatest care and skill. While it is important to note that the adhesion to the glass of the decoration, especially of the "RIFLESSI" series, is more complicated and therefore less strong than that of regular commercial mirror, our products perform perfectly when some simple guidelines are followed:

- 1) any lubricants used for the cutting of the mirror must be removed from the back of the mirror right away, as they can dissolve and damage the mirror's protective coating. It is advisable to use a lubricant made by vegetable white mineral oil (for example ENOTAP from Fenzi – Italy) In case of a handmade cut, it's sufficient to use a simple glasscutter avoiding absolutely to sprinkle oil or other substances on the part to be cut; this regards especially the "RIFLESSI" series.
- 2) After cutting the mirror, it is advisable to swipe the edge to be worked, so that approx. 1 mm is removed from the back edge of the mirror. This will avoid the possibility of the backing being "knicked" when subsequent bevelling or polishing operations are performed. It is important that these operations are performed with clean water and with not used up grinding wheels.
- 3) Avoid all abrasion against the back of the mirror.
- 4) All the above mentioned products can be installed using any quality mirror mastic which is non-acidic or neutral silicone nonacetic; ideal would be the application in parallel stripes in order to facilitate the drying process. Especially as regards the "RIFLESSI" series it is advisable to spread the mastic uniformly on the surface, avoiding to accumulate it.
- 5) Only "RIFLESSI" series regarding we recommend the nearness to heat diffusers only until max. 90° C.
